Project: SOA individual assignment

SongFinder

Description:

This project is a music platform aggregator. It can find a song on Spotify, Deezer, Itunes and Youtube.

I chose these APIs because it allows to group the purchase, the listening and the visualization of a music in an application.

I developed this project in nodeJS with the framework IONIC, it's a quick language to develop a little project like this and it's modern and reliable.

API used:

Spotify (REST): International music platform to listen music.

Deezer (SOAP): French music platform to listen music.

Itunes (REST): International music platform to buy music.

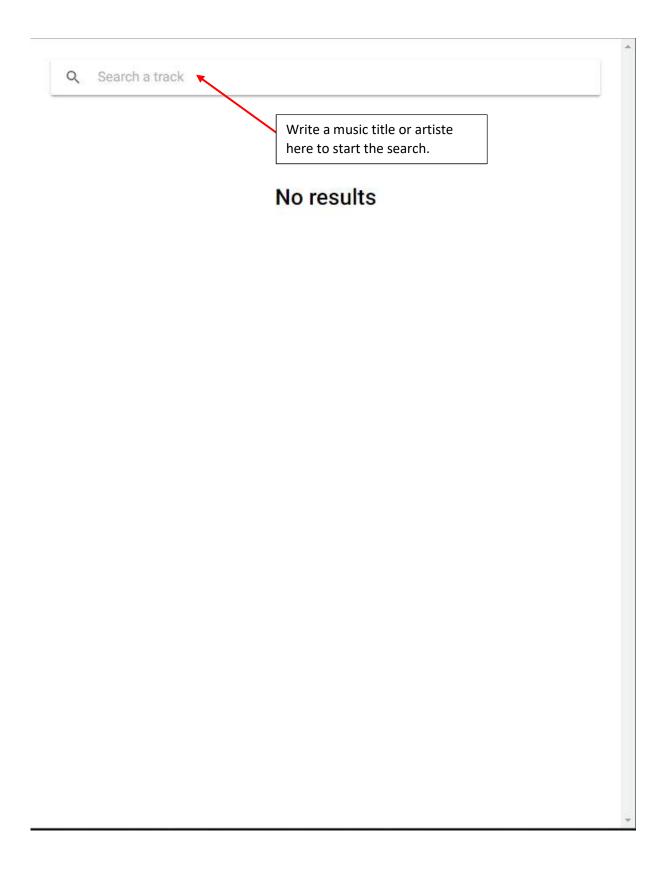

Youtube (REST): video-sharing website to watch music videos.

Changes:

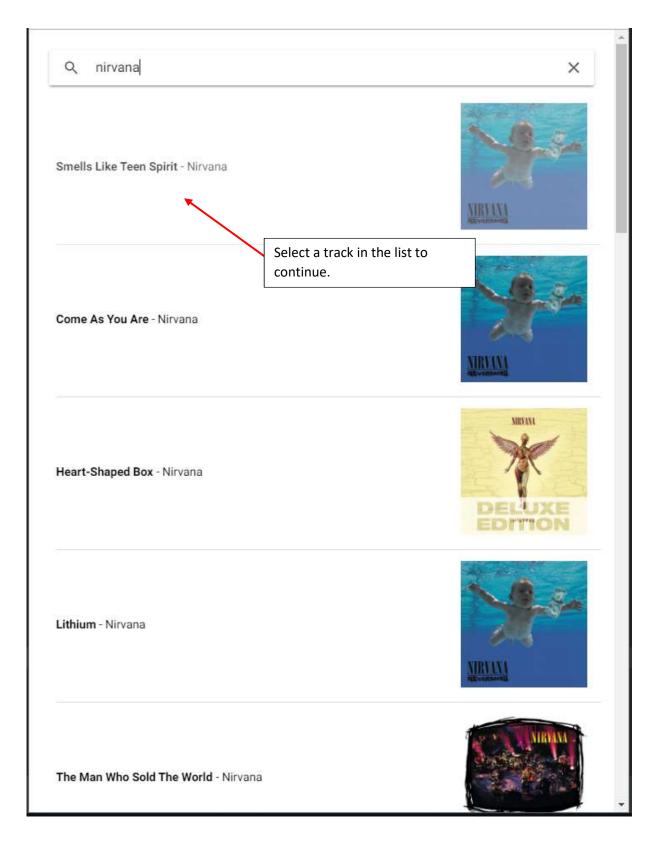

In my subject I said that I will use the soundcloud and Chartlyrics API's, but these two APIs became HS during my project. I replaced it with deezer and itunes to keep the same logic of operation.

Manual:

1 - Search page.

2 - Results page.

3 - Track page.
